DAILY CONTENT PLAN — SATURDAY, OCTOBER 10, 2026

A Bit Inside · Technology & Digital Life · *"See what's happening inside the technology you use every day."* Platforms: YouTube Shorts · TikTok · Facebook Reels · all videos 1080×1920, 30 fps, H.264 + AAC, −14 LUFS, 60–180 s, each with a custom 9:16 cover (PNG for TikTok/Facebook, JPG under 2 MB for YouTube).

Mix today: 4 evergreen + 1 emerging (80/20). 01 is this week's news (Google Playground, Oct 7). 04 and 05 are evergreen but use fresh figures (TeleGeography 2026, Internet Archive Oct 2025), so they still feel current. Tomorrow should lean emerging (2 news-led slots) to bring the 3-day average back toward 70/30.

Schedule note: this morning's 8:00 AM slot was missed (usage outage), so 01 was produced last. It's ready to schedule in any open slot.

Final checks

- Every video is between 60 and 180 s (ffprobe): 68.0 / 97.8 / 96.1 / 127.4 / 96.7 s.
- **Layout self-check passed on all 5 videos and all 5 thumbnails** (`video/layout-check.md`): titles, captions, CTA and wordmark centered at 540.0 (±2 px), everything inside x 120–960, visuals above y 1420, nothing below y 1610, no missing glyphs (✓ ✕ → ↓ drawn as vector paths), no 1-word last title lines; exported-mp4 pixel spot checks within margins.
- Hooks land in 0–2 s, with no weak openers and no forced like/follow in the voiceover, except 04's natural slot-04 call to action. The end card is visual only.
- Every claim is sourced in each script file, with accuracy notes. Mock-ups (game, token "predict" scene, index/grid, cable cross-section, page cards) are labelled illustrative in the descriptions. The token IDs in 02 are real tiktoken output.
- There are no repeats of Oct 8 topics (tap-to-pay, touchscreens, DNS, iPhone 18 Pro aperture, GPT-6 UI) or Oct 9 topics (QR damage, DNS, GPS + Einstein, AI agents, digital afterlife).
- Brand: only "A Bit Inside" branding is used. No other channels or third-party logos are referenced (company names appear as plain text only).
- Cover thumbnails are 1080×1920 with 2–5 word headlines centered on x = 540 and visuals inside the safe zone.

Note	Today's 8:00 AM slot was missed (usage outage). This is ready to schedule for 8:00 AM tomorrow or any open slot.

Why this topic

It's this week's most "wait, really?" consumer tech launch: anyone can describe a game in words and play it seconds later in a browser. One clear, surprising fact that's easy to show visually, with an honest "catch" so it isn't hype.

Hook (0–2 s)

- **Spoken:** "You can now make a video game just by typing a sentence."
- **On-screen:** TYPE A SENTENCE. GET A GAME.

- **Visual:** a prompt box already reads "a cat surfing rainbow waves" and a game window builds itself underneath: waves, then stars, then a cat on a surfboard bouncing over the waves.

Full voiceover script

[0:00 Hook] You can now make a video game just by typing a sentence.

[0:03 What launched] On October seventh, Google launched Playground, an experimental platform that turns text prompts into games you play right in your browser.

[0:12 How] Describe your idea, and it builds a first version you can test right away. Want different physics, new rules, or a new character? Just ask, in plain words. No coding, and no game engine to learn.

[0:24 Under the hood] Behind it are three Google AI models: Gemini, Nano Banana, Google's image model, and Lyria, its music model.

[0:33 Share] When you're done, keep it private, send a link to friends, or publish it to a public gallery with leaderboards. Some genres even support multiplayer. And because it all runs in the browser, you can play on a phone or a laptop.

[0:48 The catch] The catch: it's an early experiment, open only to adults in the U.S. for now, with creation limits tied to Google's AI subscriptions.

[0:57 Ending] But the idea is a little wild. The hardest part of making a game used to be the code. Now, it might just be the idea.

Visual direction

Time	Visual
0:00–0:03	Prompt box "a cat surfing rainbow waves" → game window builds (waves → stars → surfing cat, score counter).
0:03–0:12	Green "Playground" pill pops in, "OCT 7, 2026 · EXPERIMENTAL"; a browser frame ("your browser") shows the game running.
0:12–0:24	The prompt changes to "lower the gravity" (the cat jumps higher, slower) and "make the hero orange" (the cat turns orange); NO CODE ✓ and NO ENGINE ✓ chips.
0:24–0:33	Three cards pop in on cue: Gemini (language + logic, vector sparkle), Nano Banana (images, picture icon), Lyria (music, note icon).
0:33–0:48	Three option tiles: PRIVATE (lock), LINK (chain), GALLERY (bars); a LEADERBOARD card; then a phone and a laptop both running the game.
0:48–0:57	Three pills stack: EARLY EXPERIMENT · U.S. ONLY · 18+ · CREATION LIMITS.
0:57–1:08	A code block gets a red ✕ and fades into a glowing yellow light bulb above a prompt box "your idea here"; visual end card.

On-screen text

TYPE A SENTENCE. GET A GAME. → GOOGLE PLAYGROUND LAUNCHED OCT 7 → JUST DESCRIBE IT. THEN TWEAK IT. → THREE AI MODELS UNDER THE HOOD → PRIVATE, LINK, OR PUBLIC GALLERY →

THE CATCH: U.S. ADULTS ONLY → THE HARD PART IS NOW THE IDEA

Ending

A natural, slightly playful closing thought (the hard part used to be the code; now it might be the idea). No like/follow ask in the voiceover.

Thumbnail

"TYPE A SENTENCE. / GET A GAME." (white/cyan/yellow) over a prompt box "a cat surfing rainbow waves" with an arrow into a bright game window (surfing cat, stars, waves, score). Self-check passed (lines at 540.0, visual box 138–942).

To an AI, "Strawberry" Is Just a Number: What Chatbots Actually Read

Cover thumbnail
`thumbnails/02-ai-tokens-thumb.jpg`

Field	Detail
Topic	Tokens: how AI chatbots turn your text into numbers before they "read" it, and why that makes letter-counting hard
Category	AI explainer · Evergreen
Format	Problem → explanation → takeaway (token chips, ID counters, letter tiles)
Runtime	1:37.8 (97.8 s) · ffprobe-verified · within the 60–180 s rule
Video	`video/02-ai-tokens-final.mp4` (1080×1920, 30 fps, H.264 + AAC, −14 LUFS)
Thumbnail	`thumbnails/02-ai-tokens-thumb.png` (1080×1920) · `thumbnails/02-ai-tokens-thumb.jpg` (YouTube, 153 KB)

Why this topic

Everyone uses chatbots now, and the "how many r's in strawberry" fail became a well-known meme. Few people know the real reason: the model never sees letters, only token numbers. It's a simple, evergreen idea that makes a complex AI system click, and every token split and ID shown on screen is real output from OpenAI's open-source tokenizer.

Hook (0–2 s)

- **Spoken:** "To an AI chatbot, the word strawberry is just a number."
- **On-screen:** TO AN AI, "STRAWBERRY" IS JUST A NUMBER
- **Visual:** ten letter tiles s-t-r-a-w-b-e-r-r-y collapse into one red chip, which drops into a glowing yellow **101830**.

Problem (2–11 s)

"That's partly why chatbots famously stumbled when asked to count the r's in it." A chat bubble asks "How many r's in strawberry?", the bot types… and the question breaks into token chips.

Full voiceover script

[0:00 Hook] To an AI chatbot, the word strawberry is just a number.

[0:04 Setup] That's partly why chatbots famously stumbled when asked to count the r's in it. Here's what AI actually reads instead of words.

[0:11 Problem] A language model can't do math on letters. It only works with numbers. So before it reads your message, a tokenizer chops your text into pieces called tokens, and swaps each piece for an ID number.

[0:24 Pieces] Common words usually get one token each. Rarer words get split into chunks. In GPT-4o's tokenizer, doomscrolling becomes three pieces: doom, scroll, ing. And the full vocabulary holds about two hundred thousand different tokens.

[0:41 Rule of thumb] OpenAI's rule of thumb for English: one token is about four characters, or three quarters of a word. A hundred tokens is roughly seventy-five words.

[0:52 Strawberry] Now look at strawberry inside a sentence. It's a single token: number one hundred one thousand, eight hundred thirty. The model receives that number, not the letters. So to count the r's, it can't simply look. It has to remember how that token is spelled.

[1:08 Predict] And when it answers, the model predicts the next token, one at a time. Each new token is added to the sequence, and the whole reply is turned back into text for you to read.

[1:19 Limits] That's also why chatbot memory limits, and API prices, are counted in tokens, not words.

[1:27 Takeaway / ending] So the next time an AI trips over spelling, remember: it isn't reading your words. It's reading numbers that stand for them.

Visual direction

Time	Visual
0:00–0:04	Letter tiles "strawberry" → merge into one red chip → arrow → big yellow "101830" token-ID panel.
0:04–0:11	Blue chat bubble "How many r's in strawberry?", bot bubble with typing dots, then the question splits into colored token chips.
0:11–0:24	White text box types "Your phone reads tokens". "abc ✕" vs "123 ✓" cards. Then the sentence is cut into 4 chips with real IDs 9719 · 5714 · 31523 · 20290 and a terminal-style array.
0:24–0:41	"phone" = one chip (#5714). "doomscrolling" splits into doom #114026 · scroll #22699 · ing #289. A counter runs up to ~200,000 TOKENS IN THE VOCABULARY.
0:41–0:52	Three rule cards: 1 TOKEN ≈ 4 CHARACTERS (4 letter tiles), 1 TOKEN ≈ ¾ OF A WORD (bar fills to 75%), 100 TOKENS ≈ 75 WORDS (75 squares light up).
0:52–1:08	Sentence "There are three r's in strawberry." as 8 chips; the strawberry chip glows; the ID 101830 types out; ten hidden "?" letter tiles with a red ✕, then the letters reveal with the three r's

Time	Visual
	highlighted: "3 r's, from memory".
1:08–1:19	MODEL box with "next token?" emits chips one at a time; the chips merge into a reply bubble. Label: "ILLUSTRATIVE · REAL GPT-4o TOKEN SPLIT".
1:19–1:27	Two cards: MEMORY LIMIT (context window bar filling with token blocks) and API PRICES (token coins).
1:27–1:38	Loop back to the hook: letter tiles → arrow → 101830 glowing; visual Follow/Subscribe end card.

On-screen text

TO AN AI, "STRAWBERRY" IS JUST A NUMBER → WHAT DOES AI ACTUALLY READ? → STEP 1: TEXT BECOMES TOKENS → COMMON WORD = 1 TOKEN. RARE WORD = CHUNKS. → THE RULE OF THUMB → THE MODEL SEES THE NUMBER, NOT LETTERS → STEP 2: PREDICT ONE TOKEN AT A TIME → LIMITS AND PRICES ARE COUNTED IN TOKENS → IT READS NUMBERS, NOT WORDS

Takeaway / ending

A natural loop back to the opening image: the AI isn't reading your words, it's reading numbers that stand for them. No like/follow ask in the voiceover.

Thumbnail

"TO AI, WORDS / ARE NUMBERS" (white/red/yellow) over the "strawberry" letter tiles (r's in red) with an arrow down to a glowing yellow 101830 panel, "WHAT AI ACTUALLY READS" below. Self-check passed (lines centered at 540.0, visual box 182–898).

Title: To an AI, "Strawberry" Is Just a Number: How Chatbots Read Tokens

Description:
AI chatbots don't read letters. A tokenizer chops your text into tokens and swaps each one for an ID number. In GPT-4o's tokenizer, " strawberry" is a single token (101830), "doomscrolling"

splits into doom + scroll + ing, and the vocabulary has about 200,000 tokens. That's why spelling questions trip models up, and why chat limits and API prices are counted in tokens. (Token IDs are real output from OpenAI's tiktoken o200k_base encoding; the answer-generation scene is illustrative.)

Sources: OpenAI Help Center, "What are tokens and how to count them?" · OpenAI tiktoken (github.com/openai/tiktoken) · OpenAI API pricing

#Shorts #AI #ChatGPT #ABitInside

Facebook Reels (A Bit Inside Page)

Ever wondered why AI chatbots trip over simple spelling questions? They never see your letters. Your message is chopped into "tokens" and turned into numbers first. To GPT-4o's tokenizer, "strawberry" is just 101830. Here's how it works, step by step.

#ABitInside #AI #TechExplained

Sources

- OpenAI Help Center, "What are tokens and how to count them?" (tokens are pieces of words; English rule of thumb: 1 token ≈ 4 characters ≈ ¾ of a word, 100 tokens ≈ 75 words; counts vary by model and language; input and output are counted and priced in tokens): https://help.openai.com/en/articles/4936856-what-are-tokens-and-how-to-count-them
- OpenAI tiktoken (open-source tokenizer library, `o200k_base` encoding used by GPT-4o), run on Oct 10, 2026: " strawberry" → [101830]; "There are three r's in strawberry." → There · are · three · r · 's · in · strawberry · . ; " doomscrolling" → [114026, 22699, 289] = " doom" · "scroll" · "ing"; " phone" → [5714]; "Your phone reads tokens" → [9719, 5714, 31523, 20290]; vocabulary size 200,019 IDs ("about two hundred thousand"): https://github.com/openai/tiktoken
- OpenAI API pricing (prices listed per 1M tokens): https://openai.com/api/pricing/

Accuracy notes: "Strawberry is just a number" refers to the word inside a sentence (with its leading space), where GPT-4o's tokenizer gives it a single ID; at the very start of a text with no space it splits into st · raw · berry. Other models use different tokenizers and IDs. "Famously stumbled" refers to the widely shared 2024 examples; it does not claim every current model fails. The "predict" scene is illustrative of next-token generation; the token split shown is real.

Deleting a File Doesn't Erase It: Follow One Deleted Photo, Layer by Layer

Cover thumbnail
`thumbnails/03-delete-doesnt-erase-thumb.jpg`

Field	Detail
Topic	What really happens to a file when you delete it: trash → index → hard drive vs flash (TRIM + garbage collection) → encryption-key erase
Category	Curiosity / surprise · Evergreen
Format	Progressive Reveal (shocking claim → 3 layers → final twist)
Runtime	1:36.1 (96.1 s) · ffprobe-verified · within the 60–180 s rule
Video	`video/03-delete-doesnt-erase-final.mp4` (1080×1920, 30 fps, H.264 + AAC, −14 LUFS)
Thumbnail	`thumbnails/03-delete-doesnt-erase-thumb.png` (1080×1920) · `thumbnails/03-delete-doesnt-erase-thumb.jpg` (YouTube, 135 KB)

Why this topic

Everyone deletes things every day and assumes they're gone. The truth peels back in layers, each one more surprising, which fits the "wait… WHAT?" slot. It ends with a useful real-world point (how to actually erase a phone before selling it).

Hook (0–2 s)

- **Spoken:** "When you delete a file, your computer doesn't actually erase it."
- **On-screen:** DELETING A FILE DOESN'T ERASE IT

- **Visual:** a photo card turns into a dashed ghost stamped DELETED, while below it the photo's orange blocks light up in a storage grid: STILL ON THE DRIVE.

Curiosity gap (2–10 s)

"Not right away, and on some drives, not for a long time. Let's follow one deleted photo, layer by layer." Three stacked cards appear: 1 TRASH · 2 INDEX · 3 STORAGE.

Full voiceover script

[0:00 Hook] When you delete a file, your computer doesn't actually erase it.

[0:04 Setup] Not right away, and on some drives, not for a long time. Let's follow one deleted photo, layer by layer.

[0:11 Layer 1: Trash] Layer one: the trash. Pressing delete usually just moves the file to the Recycle Bin or Trash. On an iPhone, deleted photos wait in Recently Deleted for thirty days.

[0:23 Layer 2: Index] Layer two: you empty the trash. Gone, right? Not quite. Your storage keeps an index, like a library catalog that says where every file lives. Emptying the trash removes the catalog entry, and marks that space as free. The photo itself is still sitting there.

[0:40 Hard drive] On a traditional hard drive, those bits stay put until new data happens to be written on top of them. That's why recovery software can often bring deleted files back.

[0:51 Layer 3: Flash] Layer three: most phones and modern laptops use flash storage. There, the system can send a command called TRIM, telling the drive which blocks are no longer needed. The drive's own cleanup process, called garbage collection, erases them later, on its own schedule.

[1:08 Twist: the key] And the final twist. Modern phones encrypt everything they store. On an iPhone, Erase All Content and Settings destroys the encryption keys. Without the key, every leftover byte is just scrambled noise. Nothing has to be wiped bit by bit.

[1:24 Ending] So delete usually means: forget where it is. Truly erasing means making it unreadable. Worth remembering before you sell your next phone.

Visual direction

Time	Visual
0:00–0:04	Photo card → dashed ghost "DELETED"; a 8×5 storage-block grid lights up below with the photo's orange blocks: STILL ON THE DRIVE.
0:04–0:11	Small photo on top of three stacked layer cards: 1 TRASH (orange), 2 INDEX (cyan), 3 STORAGE (purple).
0:11–0:23	The photo shrinks and drops into an orange trash can (lid flips). "Recycle Bin / Trash". iPhone card: RECENTLY DELETED counting 0 → 30 DAYS.
0:23–0:40	INDEX card (photo.jpg → blocks, notes.txt, song.mp3). The photo.jpg row gets struck through in red; its blocks turn dashed "MARKED FREE", then glow: "FREE SPACE... DATA STILL HERE".
0:40–0:51	Blue new-data blocks overwrite part of the photo's blocks (NEW DATA OVERWRITES SOME BLOCKS); a green card: RECOVERED (the parts not overwritten).

Time	Visual
0:51–1:08	FLASH STORAGE outline. A pill "TRIM: these blocks aren't needed" turns the photo blocks purple; a glowing sweep erases them one by one: GARBAGE COLLECTION: ERASED LATER.
1:08–1:24	Every block fills with hex bytes; a yellow key card; on "destroys" the key splits apart under a red × and the grid becomes scrambled noise: UNREADABLE.
1:24–1:36	Two cards: DELETE = forget the location · ERASE = make it unreadable. Visual Follow/Subscribe end card.

On-screen text

DELETING A FILE DOESN'T ERASE IT → LET'S FOLLOW ONE DELETED PHOTO → LAYER 1: THE TRASH → LAYER 2: ONLY THE INDEX IS GONE → THE DATA STAYS UNTIL OVERWRITTEN → LAYER 3: FLASH CLEANS UP LATER → THE TWIST: DESTROY THE KEY → DELETE = FORGET. ERASE = UNREADABLE.

Ending

A natural, useful conclusion (delete = forget, erase = unreadable) with a practical nudge about selling a phone. No like/follow ask in the voiceover.

Thumbnail

"DELETED FILES / AREN'T GONE" (red/white/orange) above a photo sitting on a tilted trash-can lid; the can is drawn "x-ray" style with the photo's orange data blocks still inside; tagline STILL ON THE DRIVE. Self-check passed (all lines at 540.0, visual box 291–789).

Title: Deleting a File Doesn't Erase It: Where Your Deleted Photos Really Go

Description:
Pressing delete usually moves a file to the trash (iPhone keeps deleted photos in Recently Deleted for 30 days). Emptying the trash only removes the file's index entry and marks the space free. On hard drives the data stays until it's overwritten; on flash storage, TRIM and

garbage collection erase it later. The real erase? Destroying the encryption key, which is what an iPhone's Erase All Content and Settings does. (Index and block grid are illustrative; behaviour varies by device.)

Sources: Apple Support, "Delete photos on your iPhone or iPad" · Apple Platform Security, "Data Protection in Apple devices" · ArchWiki, "Solid state drive" · MakeUseOf, "What happens when you delete a file from your SSD"

Facebook Reels (A Bit Inside Page)

When you delete a photo and empty the trash, it's gone… right? Not quite. Here's what really happens inside your phone or computer, layer by layer, and the one thing that truly makes old data unreadable. Worth knowing before you sell or give away a device.

#ABitInside #Privacy #TechExplained

Sources

- Apple Support, "Delete photos on your iPhone or iPad" (deleted photos go to Recently Deleted for 30 days, then are permanently deleted): https://support.apple.com/en-us/104967
- MakeUseOf, "This is what happens to a file when you delete it from your SSD" (deleting removes the file-system reference and marks space available; data remains until overwritten; on SSDs the OS sends TRIM and garbage collection erases blocks later): https://www.makeuseof.com/what-happens-when-you-delete-file-ssd/
- ArchWiki, "Solid state drive" (TRIM / NVMe deallocate tells the controller which blocks are free; on hard drives deletion is handled only at the file-system level): https://wiki.archlinux.org/title/Solid_state_drive
- King & Vidas, "Empirical analysis of solid state disk data retention when used with contemporary operating systems," Digital Investigation (2011) (TRIM + garbage collection; the controller decides when to erase): https://www.sciencedirect.com/science/article/pii/S1742287611000375
- Apple Platform Security, "Data Protection in Apple devices" (the effaceable key is erased by Erase All Content and Settings or remote wipe; "Erasing the key in this manner renders all files cryptographically inaccessible"): https://support.apple.com/guide/security/data-protection-sece8608431d/web

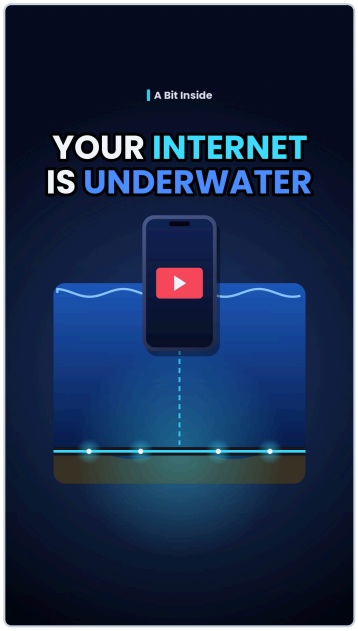

Accuracy notes: Behaviour varies by device, operating system and file system; the script hedges with "usually", "often" and "can". TRIM timing and whether deleted flash data is recoverable depend on the drive's firmware. The index card, block numbers and grid are illustrative. "Modern phones encrypt everything they store" refers to default full-storage/file-based encryption on current iPhones and Android phones; the specific key-erase claim is cited only for iPhone.

Your Internet Is Underwater: The Hair-Thin Glass Threads on the Ocean Floor

Cover thumbnail
`thumbnails/04-undersea-cables-thumb.jpg`

Field	Detail
Topic	Submarine fiber-optic cables: how almost all intercontinental internet traffic really travels
Category	Flagship · Systems explainer / journey · Evergreen, with 2026 figures
Format	Follow-the-data journey (phone → tower → fiber → sea floor) + cross-section + data cards
Runtime	2:07.4 (127.4 s) · ffprobe-verified · within the 60–180 s rule
Video	`video/04-undersea-cables-final.mp4` (1080×1920, 30 fps, H.264 + AAC, −14 LUFS)
Thumbnail	`thumbnails/04-undersea-cables-thumb.png` (1080×1920) · `thumbnails/04-undersea-cables-thumb.jpg` (YouTube, 119 KB)

Why this topic

Most people picture the internet in the air (Wi-Fi, 5G, satellites). The reality — 600+ cables, 1.5 million km of glass on the sea floor, broken about 200 times a year by anchors and fishing gear — is one of the biggest "I had no idea" facts in everyday tech. It's evergreen, but every number is from TeleGeography's 2026 figures, and it gives the most research and the richest set of scenes of the day (10 sections).

Hook (0–2 s)

- **Spoken:** "Your phone's internet isn't coming from space. It's coming from the bottom of the ocean."
- **On-screen:** YOUR INTERNET LIVES ON THE OCEAN FLOOR

- **Visual:** a satellite above a phone gets a red ×; the view drops into a cut-away ocean with a glowing cable on the sea floor and a dashed link up to the phone.

Curiosity gap (4–11 s)

"Open a video stored on another continent, and it almost certainly crossed a sea floor to reach you. Let's follow it." A packet arcs across a globe from VIDEO SERVER to YOU.

Full voiceover script

[0:00 Hook] Your phone's internet isn't coming from space. It's coming from the bottom of the ocean.

[0:05 Setup] Open a video stored on another continent, and it almost certainly crossed a sea floor to reach you. Let's follow it.

[0:12 Wireless hop] Your phone is only wireless for the first short hop, to the nearest cell tower. From there, your data rides fiber-optic cables, across land, and then under the sea.

[0:23 Scale] As of 2026, the research firm TeleGeography tracks more than six hundred active and planned submarine cables, and over one and a half million kilometers in service. That's enough to wrap around the Earth about thirty-seven times.

[0:38 Inside the cable] Up close, it's surprisingly small. In the deep ocean, a cable is about as wide as a garden hose. At its heart are glass fibers, roughly as thin as a human hair, carrying pulses of laser light. Near the shore, extra armor is added, and the cable is buried under the seabed.

[0:57 Capacity] And the capacity is huge. The MAREA cable, across the Atlantic, can carry up to two hundred twenty-four terabits per second. That's more than two million times a one-hundred-megabit home connection.

[1:09 Why not satellites] So why not satellites? Bit for bit, fiber carries far more data, at a fraction of the cost. U.S. FCC figures show satellites account for just zero point three seven percent of America's international capacity.

[1:25 Breaks] Do these cables break? All the time. Roughly two hundred faults a year. And it's not sharks. About two-thirds are caused by fishing gear and ships' anchors. You rarely notice, because networks spread traffic across several cables while the damaged one is repaired.

[1:41 Who pays] And who's paying for the new ones? Increasingly, the companies whose apps you use every day: Google, Meta, Microsoft and Amazon.

[1:51 Ending + CTA] So the next time a video loads from the other side of the world, picture a thread of glass, thin as a hair, lying in the dark on the ocean floor. Follow A Bit Inside to see the next hidden layer of the tech you use every day.

Visual direction

Time	Visual
0:00–0:05	Satellite + phone; red × on the satellite on "space"; the phone rises as a cut-away ocean slides in with a glowing sea-floor cable and pulses of light.

Time	Visual
0:05–0:12	Rotating globe; a cyan arc draws from VIDEO SERVER to YOU with a light packet.
0:12–0:23	Split land/sea diagram: phone → yellow WIRELESS rings → cell tower → FIBER down and along the land → SUBSEA CABLE along the sea floor.
0:23–0:38	Counter cards: 600+ ACTIVE + PLANNED CABLES; 1.5 MILLION KM IN SERVICE; a small globe gets wrapped by ring after ring up to ×37.
0:38–0:57	Big cable cross-section (jacket, steel/copper, insulation, core); eight fibers light up cyan on "laser"; pills: GLASS FIBERS ~ HAIR-THIN, ~ GARDEN-HOSE WIDE (DEEP SEA); armor wires grow around it: NEAR SHORE: ARMOR + BURIED.
0:57–1:09	Atlantic strip US ↔ SPAIN with MAREA drawing across; counter to 224 Tbps (POTENTIAL CAPACITY); card HOME 100 Mbps → × 2,000,000+.
1:09–1:25	Satellite; FIBER vs SATELLITE bars (labelled illustrative); card 0.37% OF U.S. INTERNATIONAL CAPACITY (FCC).
1:25–1:41	Three parallel sea-floor cables; SHARKS: RARE; an anchor drags down and the middle cable sparks red; card ~200 FAULTS / YEAR, about 2/3 fishing gear + anchors; TRAFFIC REROUTES, then the cable relights.
1:41–1:51	Ocean strip with glowing cable; pills Google · Meta · Microsoft · Amazon; MAJOR INVESTORS IN NEW CABLES.
1:51–2:07	Phone floating above the dark ocean, dashed line down to a single glowing thread on the sea floor; visual Follow/Subscribe end card.

On-screen text

YOUR INTERNET LIVES ON THE OCEAN FLOOR → FOLLOW ONE VIDEO ACROSS THE SEA → WIRELESS FOR ONE SHORT HOP → 600+ CABLES. 1.5 MILLION KM. → AS WIDE AS A GARDEN HOSE → 224 TERABITS PER SECOND → SO WHY NOT USE SATELLITES? → ~200 FAULTS A YEAR. SHARKS? RARELY. → WHO PAYS FOR THE NEW ONES? → A HAIR-THIN THREAD UNDER THE SEA

Call to action (slot 04 only)

A natural, earned CTA tied to the payoff image: "Follow A Bit Inside to see the next hidden layer of the tech you use every day." Spoken once at the end, after the story resolves; plus the visual end card.

Thumbnail

"YOUR INTERNET / IS UNDERWATER" (white/cyan/blue) over a phone playing a video, dipped into a cut-away ocean with a dashed link down to a glowing cable on the sea floor. Self-check passed (lines at 540.0, visual box 150–930).

Slot 05 · 8:30 PM (Yangon) · Deep / Future-of-Life

The Internet Is Quietly Forgetting

Cover thumbnail
`thumbnails/05-internet-forgetting-thumb.jpg`

Field	Detail
Topic	Link rot and "digital decay": how much of the web disappears, why, who tries to save it, and what it means for your own memories
Category	Deep / reflective · Evergreen (research from 2024, archive milestone from Oct 2025)
Format	Calm, soft-lit reflective explainer (floating page cards, fading grids, tide ending)
Runtime	1:36.7 (96.7 s) · ffprobe-verified · within the 60–180 s rule
Video	`video/05-internet-forgetting-final.mp4` (1080×1920, 30 fps, H.264 + AAC, −14 LUFS)
Thumbnail	`thumbnails/05-internet-forgetting-thumb.png` (1080×1920) · `thumbnails/05-internet-forgetting-thumb.jpg` (YouTube, 137 KB)
Pacing	Slower voice (−7% rate), longer pauses between sections, softer music (66 BPM, very light kick).

Why this topic

We treat the internet as a permanent record, but research shows it's surprisingly fragile. That gentle surprise makes for a calm, reflective close to the day, and it ends on something personal and actionable without fear-mongering. It's different from yesterday's "digital afterlife" (what happens to your phone after you die): this is about the web itself forgetting.

Hook (0–2 s)

- **Spoken:** "The internet feels permanent. But it's quietly forgetting."
- **On-screen:** THE INTERNET IS QUIETLY FORGETTING

- **Visual:** nine softly floating webpage cards; on "quietly", five of them fade one by one into dashed outlines.

Full voiceover script

[0:00 Hook] The internet feels permanent. But it's quietly forgetting.

[0:04 Setup] Think of an old blog you loved, a forum you grew up on, a page you bookmarked years ago. Try opening it today.

[0:12 Decay] Pew Research Center checked nearly a million webpages captured over a decade. By late 2023, a quarter of them were gone. For pages from 2013, it was thirty-eight percent.

[0:26 Link rot] Even the links we use as evidence are breaking. In Pew's sample of English Wikipedia pages, more than half had at least one dead reference link. Researchers call it link rot.

[0:38 Why] Most pages vanish for ordinary reasons. A site gets redesigned. A company shuts down. Someone stops paying for a domain. Nobody decides to erase it. It just stops being looked after.

[0:52 The archive] Some people are trying to remember for us. Since 1996, the Internet Archive has been saving snapshots of the web. In October 2025, its Wayback Machine passed one trillion archived web pages.

[1:08 Personal] But the pages that matter most to you, the photos, the messages, the little things you wrote, live in accounts and devices that won't keep them forever on their own.

[1:19 Ending] So maybe the internet isn't a library. It's more like a tide. Things wash up, and things wash away. If something matters, keep a copy somewhere you control. And let the rest drift, gently, out to sea.

Visual direction

Time	Visual
0:00–0:04	3×3 constellation of soft webpage cards gently bobbing; five fade into dashed outlines.
0:04–0:12	A browser window types "myoldblog.example" (reserved example domain); on "today" the page dissolves into a quiet grey 404 / PAGE NOT FOUND.
0:12–0:26	"~1,000,000 PAGES, 2013–2023"; a 10×10 grid of squares: 25 fade (25% GONE, ALL YEARS), then the grid turns orange and 38 have faded (38% OF 2013 PAGES GONE).
0:26–0:38	A REFERENCES panel with four chain-link entries; two links pull apart and turn red with ×; card 54% OF PAGES had a dead reference link.
0:38–0:52	Three soft cards appear in turn: REDESIGNED · SHUT DOWN · DOMAIN LAPSED, then dim; "no one hits delete".
0:52–1:08	Page cards drift down into a glowing archive box, SINCE 1996; a counter rolls up to 1,000,000,000,000.
1:08–1:19	A phone in a soft purple glow with a photo, chat bubbles and a note; labels PHOTOS · MESSAGES · NOTES light up as named, then dim slightly.
1:19–1:37	Cards bob on gentle waves (the tide); on "keep a copy" one card rises out of the water, turns green: YOUR COPY; the others drift away; visual end card.

On-screen text

THE INTERNET IS QUIETLY FORGETTING → TRY OPENING AN OLD LINK → 38% OF PAGES FROM 2013 ARE GONE → EVEN THE SOURCES ARE BREAKING → NOBODY ERASES IT. IT JUST FADES. → ONE ARCHIVE SAVED 1 TRILLION PAGES → WHAT ABOUT YOUR OWN PAGES? → SAVE WHAT MATTERS. LET THE REST DRIFT.

Ending

A calm, natural conclusion with the tide metaphor and one gentle, practical thought (keep a copy of what matters). No cliffhanger and no like/follow ask in the voiceover.

Thumbnail

"THE INTERNET / IS FORGETTING" (white/purple) over a 3×3 grid of webpage cards where four have faded to dashed outlines and the center is a red 404; tagline 38% OF 2013's PAGES: GONE. Self-check passed (all lines at 540.0, visual box 198–882).

Title: The Internet Is Quietly Forgetting: Where Old Webpages Go

Description:
Pew Research Center checked nearly a million webpages from 2013–2023: a quarter were gone by October 2023, and 38% of pages from 2013. More than half of the English Wikipedia pages in their sample had at least one dead reference link. Meanwhile the Internet Archive's Wayback Machine passed one trillion archived pages in October 2025. A calm look at link rot, and why it's worth keeping a copy of what matters to you. (Visuals are illustrative.)

Sources: Pew Research Center, "When Online Content Disappears" (2024) · Internet Archive Blogs, "One Trillion Web Pages Archived" (2025)

#Shorts #Internet #DigitalLife #ABitInside

Facebook Reels (A Bit Inside Page)

Remember an old blog, forum or website you used to love? There's a good chance it's gone. Research shows that a big share of the web quietly disappears every decade. Here's why it happens, who's trying to save it, and what it means for the memories you keep online. What's one old website you miss?

#ABitInside #Internet #DigitalLife

Sources

- Pew Research Center, "When Online Content Disappears" (May 17, 2024): a sample of just under 1 million pages from Common Crawl, 2013–2023; 25% no longer accessible as of October 2023; 38% of pages from 2013 not available; 54% of sampled English Wikipedia pages have at least one reference link to a page that no longer exists; most losses are individual pages deleted or removed on otherwise functional sites, 9% from whole domains no longer functional: https://www.pewresearch.org/data-labs/2024/05/17/when-online-content-disappears/
- Internet Archive Blogs, "One Trillion Web Pages Archived: Internet Archive Celebrates a Civilization-Scale Milestone" (Oct 31, 2025): the Wayback Machine passed one trillion archived web pages in October 2025; saving the web since 1996: https://blog.archive.org/2025/10/31/one-trillion-web-pages-archived-internet-archive-celebrates-a-civilization-scale-milestone/

Accuracy notes: "Nearly a million" = Pew's "just under 1 million". "By late 2023" = Pew's check date of October 2023. The reasons in the "why" scene (redesigns, shutdowns, lapsed domains) are illustrative everyday examples, consistent with Pew's finding that most losses are pages removed from working sites and some are whole domains that no longer work. "myoldblog.example" uses the reserved .example domain. The squares, cards and archive box are illustrative.

85	84	80	86	84	80	74	**83**

🏆 Post of the Day: 04 · "Your Internet Is Underwater" (5:30 PM flagship)

It has the strongest hook of the day (it flips the belief that the internet comes "from the air"), it's highly shareable ("I had no idea"), and it's the most researched piece: every number is from TeleGeography's 2026 FAQ (600+ cables, 1.5 million km, 224 Tbps MAREA, ~200 faults a year, 0.37% satellite share). It ends on a strong, natural call to follow.
Runner-up: 03 "Deleting a file doesn't erase it", the best pure "wait... WHAT?" reveal, with a useful takeaway.
